RISK MANAGEMENT PLAN

EU-GVP Executive Summary

Workora Pharmacovigilance Training – Task 6

Prepared by	Prathmesh Vijay Nikum
Document type	Risk Management Plan – Executive Summary
Product	Newly launched product
Regulatory framework	EU Good Pharmacovigilance Practices (EU-GVP) principles
Purpose	Summarize the safety profile, pharmacovigilance activities and risk minimization measures for a newly launched product.

Training / educational use only. This document is not a marketing authorization submission or a clinical document.

1. Product Overview

This Risk Management Plan (RMP) executive summary is structured around the EU-GVP approach for a newly launched medicinal product. The purpose is to identify the important risks and areas of missing information, define routine and additional pharmacovigilance activities, and describe proportionate risk minimization measures. The final product-specific RMP should be maintained as new safety information becomes available.

2. Safety Specification

The safety specification is organized into three core areas: important identified risks, important potential risks, and missing information. For a newly launched product, the safety profile should be continuously reviewed using pre-authorisation evidence, clinical-trial data, post-marketing reports, literature, and any other relevant safety information.

Safety area	Assessment focus	Management approach
Important identified risks	Adverse reactions with sufficient evidence of an association with the product.	Routine monitoring, signal detection, case assessment and periodic safety review.
Important potential risks	Events for which an association is suspected but evidence is not yet conclusive.	Enhanced monitoring where justified, targeted review and signal evaluation.
Missing information	Areas where relevant safety data are limited or unavailable in the target population or use setting.	Focused follow-up and additional data generation where scientifically justified.

3. Pharmacovigilance Plan

Routine pharmacovigilance activities will form the baseline safety monitoring system. Additional activities should be introduced when routine monitoring alone is insufficient to characterize an important risk or address a specific uncertainty.

Activity	Purpose	Output
Individual case safety report (ICSR) collection and assessment	Identify, assess and document suspected adverse reactions.	Validated case records, follow-up information and safety signals.
Signal management	Detect and evaluate new or changing safety signals.	Signal assessments and documented conclusions.
Literature monitoring	Identify relevant published safety information.	Literature review records and reportable cases/signals.
Aggregate safety review	Evaluate cumulative safety information over time.	Periodic safety evaluation and updated risk profile.
Additional PV activities, when required	Address specific risks or missing information not adequately characterized by routine activities.	Targeted evidence and updated benefit-risk assessment.

4. Risk Minimization Measures

Risk minimization should be proportionate to the nature and importance of each identified or potential risk. Routine measures are applied through product information and standard communication. Additional measures may be used when a risk requires targeted intervention.

Measure	Purpose	Implementation
Product information / labeling	Communicate important safety information to healthcare professionals and patients.	Warnings, precautions, contraindications and adverse-reaction information as applicable.
Patient alert card	Provide patients with concise safety instructions and key warning information.	Distributed where an important risk warrants direct patient awareness.
Educational brochure	Support correct use and recognition/management of relevant risks.	Targeted educational material for patients and/or healthcare professionals.
Additional targeted measures	Reduce a specific risk when routine measures are insufficient.	Implemented only when justified and monitored for effectiveness.

5. Effectiveness and Review

The effectiveness of risk minimization measures should be assessed using predefined indicators where applicable. Safety data, signal activity, case trends, utilization patterns and available effectiveness information should be reviewed to determine whether the measures remain appropriate. The RMP should be updated when important new information changes the benefit-risk balance or the understanding of a safety concern.

6. Overall Risk Management Approach

The overall approach is to maintain continuous safety surveillance, promptly evaluate emerging signals, generate additional evidence when needed, and communicate important risks through appropriate routine or additional risk minimization measures. The safety specification and pharmacovigilance plan should remain aligned with the evolving benefit-risk profile of the product.

7. Training Disclaimer

This document is an educational RMP executive-summary exercise prepared from the Workora Task 6 brief and supplied training material. Product-specific risks, study commitments, regulatory decisions and exact safety measures must be based on the applicable medicinal-product evidence and regulatory requirements. No unsupported product-specific risk has been invented in this training document.
