PHARMACOVIGILANCE SYSTEM MASTER FILE

PSMF Main Body Summary

Workora Pharmacovigilance Training – Task 7

Prepared by	Prathmesh Vijay Nikum
Document type	PSMF main body summary
Scope	Pharmacovigilance system, QPPV oversight, safety systems, processes and quality framework
Source period	Training data supplied in the Workora Task 7 pack
Status	Training / educational document

All identifiers and system information in the training pack are synthetic and de-identified. This document is prepared for educational analysis and is not a regulatory submission.

1. Organisational Structure and QPPV Responsibilities

The pharmacovigilance system is structured around defined operational, medical-review, quality and information-technology responsibilities. The QPPV function provides overall oversight of the pharmacovigilance system, including supervision of safety processes, quality controls, compliance activities and escalation of significant safety or system issues. The supplied training pack identifies the QPPV as the owner of several core SOPs, while Safety Operations, Quality Assurance, Quality and IT have defined supporting responsibilities.

Function / role	Primary responsibility indicated by training data
QPPV	Overall PV oversight; ownership of case intake, medical review, aggregate reporting, vendor oversight and audit/CAPA procedures.
Safety Operations	Signal management and literature monitoring activities.
Quality Assurance	Business continuity and quality-system support.
Quality	Ownership/oversight of safety-system controls and signal-analytics system records in the supplied inventory.
IT	Ownership of the safety database and training-record systems in the supplied inventory.

2. Sources of Safety Data

The PV system should receive and evaluate safety information from applicable sources, including individual case safety reports, medical and clinical information, scientific and medical literature, post-marketing sources, partners or vendors, and other relevant information channels. The supplied Task 7 data specifically document case intake and literature monitoring as controlled PV processes. Source-specific procedures and responsibilities should be maintained through the applicable SOPs.

3. Computerised Systems and Safety Database Architecture

The supplied inventory identifies four computerised systems supporting the PV quality framework. The safety database is identified as PV-SYS-01 and is recorded as validated. Document management, training records and signal analytics are separately identified systems. All four systems have weekly backup frequency recorded in the inventory. Three systems currently carry an open remediation status and therefore require continued quality oversight and documented follow-up.

System ID	Purpose	Owner	Validation status	Backup	Last access review
PV-SYS-01	Safety database	IT	Validated	Weekly	2026-05-20
PV-SYS-02	Document management	Quality	Remediation open	Weekly	2026-02-28
PV-SYS-03	Training records	IT	Remediation open	Weekly	2026-06-27
PV-SYS-04	Signal analytics	Quality	Remediation open	Weekly	2026-05-05

4. PV Processes and Signal Management Workflow

The core PV workflow begins with receipt and intake of safety information, followed by case processing and medical review as applicable. Relevant information is assessed for completeness and follow-up needs, while safety data are continuously reviewed for signals. Signal management is assigned to Safety Operations in the SOP register, with the QPPV providing overall oversight. Literature monitoring is also identified as a controlled process.

At a high level, the workflow is: safety information received → case intake and documentation → medical review / assessment → data quality and follow-up → signal detection and evaluation → aggregate safety review → escalation and risk-management action where warranted.

5. Performance Indicators

Performance indicators should be used to monitor whether the PV system is functioning effectively and within defined timelines. Appropriate indicators may include case-processing timeliness, follow-up completion, literature-monitoring performance, signal-management timeliness, training completion, quality findings and CAPA status. The supplied data provide training-completion percentages for the controlled SOPs and can therefore be used as a documented quality indicator.

SOP	Process	Training completion
PV-SOP-001	Case Intake	95%
PV-SOP-002	Medical Review	87%
PV-SOP-003	Signal Management	93%
PV-SOP-004	Aggregate Reports	97%
PV-SOP-005	Vendor Oversight	98%
PV-SOP-006	Business Continuity	92%
PV-SOP-007	Audit and CAPA	96%
PV-SOP-008	Literature Monitoring	94%

6. Quality Management System

The quality system is supported by controlled SOPs covering case intake, medical review, signal management, aggregate reports, vendor oversight, business continuity, audit and CAPA, and literature monitoring. Version and effective-date information are maintained in the supplied SOP register. Training completion is recorded for each listed SOP, providing evidence of an established training-control process.

SOP ID	Title	Owner	Version	Effective date
PV-SOP-001	Case Intake	QPPV	4.2	2025-02-25
PV-SOP-002	Medical Review	QPPV	4.3	2025-04-01
PV-SOP-003	Signal Management	Safety Operations	3.3	2025-04-21
PV-SOP-004	Aggregate Reports	QPPV	4.5	2025-02-08
PV-SOP-005	Vendor Oversight	QPPV	2.2	2025-03-25
PV-SOP-006	Business Continuity	Quality Assurance	3.0	2026-01-04
PV-SOP-007	Audit and CAPA	QPPV	3.5	2025-05-26
PV-SOP-008	Literature Monitoring	Safety Operations	1.1	2026-07-06

7. Audit, CAPA and Business Continuity

Audit and CAPA activities are represented by PV-SOP-007, owned by the QPPV, while business continuity is covered by PV-SOP-006 under Quality Assurance. These controls support the ability to identify deficiencies, document corrective and preventive actions, and maintain critical PV operations during disruption. The training pack does not provide a separate audit-history log; therefore, no audit findings or CAPA records have been invented in this summary.

8. System Access, Validation and Data Protection Controls

The system inventory records validation status, backup frequency and last access-review dates for the four listed PV systems. The safety database is recorded as validated. Document management, training records and signal analytics are marked 'Remediation open'. These open items should remain subject to documented remediation tracking and quality oversight until formally closed.

9. PSMF Section Checklist

Required PSMF area	Covered in this summary
QPPV responsibilities	Yes
Organisational structure	Yes
Sources of safety data	Yes
Computerised systems	Yes
PV processes	Yes
Performance indicators	Yes
Quality system	Yes
Annexes	Yes

10. Assumptions and Limitations

This summary is based only on the synthetic materials supplied in the Workora Task 7 training pack. Where a specific organisational name, QPPV identity, vendor agreement, audit history, validation report, CAPA record or detailed system architecture was not provided, the information has not been fabricated. The document describes the system at summary level and should not be interpreted as a complete operational PSMF.

11. Conclusion

The documented training system contains defined PV responsibilities, controlled SOPs, computerised safety systems, quality controls and supporting performance indicators. The QPPV role provides overall PV oversight, while operational, quality and IT functions support specific elements of the system. The supplied inventory also highlights remediation-open items that require ongoing quality management. Together, these elements provide the main-body framework expected for an audit-ready PSMF summary.
